

30 DAYS CODING

DAY 3

Given an array of integers say **nums** and an integer say **target**, return indices of the two numbers such that they add up to target.

You may assume that each input would have **exactly one solution**, and you **may not use the same element twice**.

You can return the answer in any order.

30 DAYS CODING

DAY 3

Example:

Input: `nums = [2,7,11,15]`, `target = 9`

Output: `[0,1]`

Explanation:

`nums[0] + nums[1] == 9`, so we
return `[0, 1]`.

Solve by more than one technique !!
